

# Aggregation switch access optical module

## Overview

A fiber optic aggregation switch is a high-capacity network device designed to integrate and manage multiple fiber optic connections from access layer switches into fewer and faster uplink connections to the core network. It also enables easy expansion by simply adding more fiber or network switches. Long-distance installations often require fiber optic cables to connect different sites because of. The Xingmai Passive Ethernet Network (PEN) is an all-optical campus network solution based on the passive technology. Faster replacement and priority support, covered for 5 years. High-performance 10G SFP modules for optimal connectivity. At the heart of a point-to-multi-point or passive optical network (PON) is the optical line terminal (OLT). The access layer switch is the equipment of the switching. An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers.
