

# Are there steel wires in the middle of outdoor optical cables

## Overview

Because the optical fiber itself is very fragile and cannot be directly applied to the wiring system, it is usually bundled, with a protective casing outside and a tensile wire in the middle. This is the so-called optical cable, and the optical cable usually. Outdoor optical cable, simply speaking, an optical cable used outdoors, is a kind of optical cable. It is durable and can withstand wind, sun, cold and freezing, and the outer packaging is thick. Whether you're linking buildings, running broadband in rural areas, or building 5G infrastructure, the right cable matters. Outdoor fiber optic cables are designed to withstand harsh environmental conditions. These two types of fiber optic cables have a similar “8”-shaped structure, and the upper part of the whole is filled with steel wires to increase the longitudinal tensile strength of the optical cable itself.
