

BESS New Energy Storage System for Metropolitan Area Networks

Overview

Siemens Energy fully integrated Battery Energy Storage System (BESS) combines advanced components like battery systems, inverters, transformers, and medium voltage switchgear with seamless electrical and I&C integration for precise control and management. Some countries are upgrading transmission networks or adopting digital grids that provide real-time data and automate management tasks, while others are using new mechanisms to influence demand, such as spot tariffs for end users. These resources electrically connect to the grid through an inverter— power electronic devices that convert DC energy into AC energy—and are referred to as inverter-based resources (IBRs). The core purpose of energy storage is simple: Battery storage acts as an energy buffer between power generation and power consumption. Indeed, during peak demand hours, BESS can be.
