

Brunei Relay Protection Tester Principle

Overview

A relay protection tester is a core device used to verify the performance of relay protection devices. Its working principle can be summarized as “signal excitation – behavior detection. The recommended test modules for relay tests are: DC test, AC and DC test, AC test, differential test, differential harmonic test, Power impedance, power direction. When the transformer wiring type is Y/Y (Y0), the test wiring is very simple: when testing phase A, the tester IA is connected to the phase A of the high voltage side, and the tester IB is connected to the phase a of the low voltage side. After the neutral line of the high and low voltage sides is. Responsible for ensuring the protection and reliability of electrical networks through relay protection systems, fault detection, and safety operations. Copyright Government of Brunei Darussalam.
