

# Can there be multiple core switches

## Overview

The core-type layer is made up of multiple core switches that operate at high speeds. As a result, it increases the network's bandwidth. I want to provide best redundancy for an access switch (Cisco 3650) when connecting to two core switches (Cisco 9500 series), as show in attached topology. My question is, should I configure the 2 uplinks as a port channel?

Or. It is a powerful backbone switch in the center of the network core layer, which centralizes multiple aggregation switches to the core and implements LAN routing. All servers are in 1G and 8 SFP+ ports are unused. Original connection was wired with Cat 5 and unmanaged switches but we are buying new POE switches (7-8 in numbers) and my question is: Can we buy 10G uplink access. I've two switches both c9200L-24P-4T which are going to be my core switches.
