

# Dangerous areas of optical cables

## Overview

Run fiber cables through conduit or sealed trays in classified areas and use appropriate glands at entry points. This prevents flammable gas or dust from traveling along cable paths. Keep optical transmitter power within. Industrial sites such as oil refineries, chemical plants, grain processing facilities, and certain manufacturing or nuclear facilities often contain hazardous (explosive) atmospheres. In these environments, a spark or excessive heat from electronic equipment can ignite flammable gases, vapors, or. Optical fibers are commonly used for data transmission in industrial environments, particularly when cable runs exceed 100 meters and copper Ethernet is no longer viable. The general assumption is simple: once installed, the cable does its job - transmitting data from point A to B - and that's it. Understanding the safety hazards that go with fiber optic cable is critical for those who install or maintain fiber optic systems. There is no risk of electrocution, no magnetic field, no radio waves.
