

# Does an optical splitter have to be connected before the ONU

## Overview

The structure of primary light splitting is an OLT-optical splitter-ONU, and the optical splitters from OLT to ONU are all connected in parallel. Realize the control, management, and ranging functions of user equipment ONU. Optical Network Unit (ONU)/Optical Network Terminal (ONT) ONU converts optical signals transmitted. A Gigabit Ethernet Passive Optical Network (GEPON) system is generally composed of an optical line terminal (OLT) at the service provider's central office and a number of optical network units (ONUs) or optical network terminals (ONTs) near end users, as well as the optical splitter. Unlike AON (Active Optical Network), where multiple customers connect to a single transceiver. Optical splitters play an important role in FTTH PON networks where a single optical input is split into multiple output, thus allowing a single PON interface to be shared among many subscribers. The optical splitters have no active electronics and don't require any power to operate.
