

# How many beam splitters are typically needed for operation

## Overview

Beam splitters are sometimes used to recombine beams of light, as in a Mach-Zehnder interferometer. In this case there are two incoming beams, and potentially two outgoing beams. But the amplitudes of the two outgoing beams are the sums of the (complex) amplitudes calculated from each of the incoming beams, and it may result that one of the two outgoing beams has amplitude zero. OverviewA beam splitter or beamsplitter is an that splits a beam of into a transmitted and a reflected beam. It is a crucial part of many optical experimental and measurement systems, such as In its most common form, a cube, a beam splitter is made from two triangular glass which are glued together at their base using polyester,, or urethane-based adhesives. (Before these synthetic. For beam splitters with two incoming beams, using a classical, lossless beam splitter with  $E_a$  and  $E_b$  each incident at one of the inputs, the two output fields  $E_c$  and  $E_d$  are linearly related to the inputs thro.
