

How to configure IP addresses for Huawei core switches

Overview

Since Huawei switches cannot directly configure IP on the interface, they generally use `vlanif` configuration. The `vlanif` interface can be understood as a special interface corresponding to `vlan`, and IP can be configured to run the routing protocol. The interface view is displayed. ARP maps an IP address to a MAC address. ARP provides some extended functions, such as proxy ARP, gratuitous ARP, ARP security, and so on. Configuring an IP address on a Huawei switch isn't just a technical checkbox—it's the foundation of a reliable, responsive network. Whether you're setting up a new switch or troubleshooting connectivity gaps, getting this step right ensures seamless communication between devices, servers. This document describes the management interfaces supported by switches and how to configure management IP addresses for switches. For example: Replace `USERNAME` with the new username, set the password, define service-type (telnet, ssh, etc).
