

Indoor fiber optic cables need to be pre-installed

Overview

Indoor cables can be installed directly, but you might consider putting them inside innerduct. Innerduct provides a good way to identify fiber optic cable and protect it from damage, generally a result of someone cutting it by mistake! You can get the innerduct with pulling. Fiber optic cables are categorized based on their deployment environment: indoor fiber optic cables and outdoor fiber optic cables. Each type is designed with specific features to ensure optimal performance under varying conditions. Indoor fiber optic cables are commonly used in buildings, offices. CAUTION: Before starting any cable installation, all personnel must be thoroughly familiar with all applicable Occupational Safety and Health Act (OSHA) regulations, the National Electric Safety Code (NEC), state and local regulations, and company practices and policies. On long runs, use proper lubricants and make sure they are compatible with the cable jacket. Single-mode cables use a very narrow core, typically 9 micrometers, supporting the long distances and high bandwidth required by internet. This article explains, in simple and easy-to-understand steps, how to install fiber optic cables in both indoor and outdoor environments.
