

Laying fiber optic cables and running cable trays

Overview

Optical-fiber cable should always be run in trays to avoid as much tension, crushing and bending as possible. Routes should be inspected for sharp turns, snags (sometimes from other cables) and rough surfaces. Fiber optic cables have Kevlar aramid yarn or a fiberglass rod as their strength member. On really. Minimize mechanical pressure on the outer sheath at crossing points: (armoured) cables crossing each other generate points of high pressure, so it is important when laying in figure 8 loops it is done in a correct way. When laying loops of fiber on a surface during a pull, use "figure-8" loops to. The purpose of this AE Note is to outline the use of fiber optic cables in "tray rated" environments. Observation Respect the Bend Radius: The 20x/10x Rule 2 2. What do we mean by the "installation process?"

" Assuming the design is completed, we're looking at the process of physically installing and completing the network, turning the design. Fiber optic cable may be installed indoors or outdoors using several different installation processes.
