

Pluggable coherent optical module

Overview

Coherent pluggable transceivers are compact optical modules that integrate coherent optical technology into a form factor that can be easily plugged into switches, routers and other network equipment. Optimize your network by selecting from the most complete range of transceivers anywhere – for ETHERNET, HBA, storage area network (SAN), datacenters, campus LANs, and. Our pluggable coherent modules are used across our optical network platforms, converged IP-optical routing and fixed network access solutions. They can also be deployed in third-party and white box switches and routers to provide market-leading integrated coherent transport solutions. With ever-increasing data traffic, web-scale, metro-area, and long-haul network operators are realizing. As a pioneer in coherent optical technology, our vision was clear: Deliver silicon-based interconnects that transform cloud and communication networks by simplifying these networks, digitizing numerous complex analog functions, and providing significant improvements in speed, capacity, and power. Coherent pluggable transceivers have transformed optical communications, providing substantial improvements in wavelength capacity, reach and spectral efficiency while also reducing costs per bit and power consumption. But what's inside these uniquely compact yet powerful devices?

Follow along on.

Coherent optical module refers to a typically hot-pluggable coherent optical transceiver that uses coherent modulation (BPSK/QPSK/QAM) rather than amplitude modulation (RZ/NRZ/PAM4) and is typically used in high-bandwidth data communications applications. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside world through a fiber optic cable. The technical details of coherent op
