In order to ensure that the relay protection device can operate correctly in the case of power system failure, the relay protection device and its secondary circuit in operation should be verified and inspected regularly in time to ensure that the device is intact and. This happens because the main function of protection devices is related to operation under fault conditions so these devices cannot be tested under normal operating conditions. This problem is worsened by the growing complexity of protection arrangements, application of protection relays with. Protective relays and devices have been developed over 100 years ago to provide “lastline”of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. Long term cost reduction (TCO) for trainings and maintenance by reduce variety of relays A fast and selective arc fault mitigation for air-insulated LV & MV switchgear and Relion protection and control relays and sensor. Abstract: This paper introduces the importance of comprehensive relay protection device, the key role it plays in the power system, the verification cycle and maintenance content of relay protection device, and improves the utilization efficiency of equipment and reduces the maintenance cost of.
