

Raid 4 Bridges

Overview

The most common types are RAID 0 (striping), RAID 1 (mirroring) and its variants, RAID 5 (distributed parity), and RAID 6 (dual parity). Multiple RAID levels can also be combined or nested, for instance RAID 10 (striping of mirrors) or RAID 01 (mirroring stripe sets). Overview In, the standard RAID levels comprise a basic set of ("redundant array of independent disks" or "redundant array of inexpensive disks") configurations that employ the techniques of. RAID 0 (also known as a stripe set or striped volume) splits ("") data evenly across two or more disks, without information, redundancy, or. Since RAID 0 provides no fault tolerance o. RAID 1 consists of an exact copy (or) of a set of data on two or more disks; a classic RAID 1 mirrored pair contains two disks. This configuration offers no parity, striping, or spanning of disk space across multiple dis.
