

# The circuit breaker tripped at the power distribution box with residual electricity connected to the grid

## Overview

The most common reason for an RCD or GFCI tripping is moisture entering the circuit wires, a light fixture outside or somewhere else like the main fuse box. Understanding the most common causes can help you take the. A residual-current device (RCD), residual-current circuit breaker (RCCB) or ground fault circuit interrupter (GFCI) is an electrical safety device, more specifically a form of Earth-leakage circuit breaker, that interrupts an electrical circuit when the current passing through line and neutral. The Earth Wire, also known as the Ground Wire or Circuit Protective Conductor is a safety earth electrical connection that connects all exposed conductive parts of the electrical system to EARTH. We've all been there – one minute you're enjoying a cosy evening at home, and the next, the lights go out or the sockets stop working. Its importance and wide application in electrical systems make it an indispensable electrical. An RCD, or Residual Current Device, is a crucial safety device that protects homes and businesses from electric shocks and fires.
