In order that protective relay system may perform this function satisfactorily, it should have the following qualities: (i) Selectivity (ii) speed (iii) sensitivity (iv) reliability (v) simplicity (vi) economy (i) Selectivity: it is the ability of the protective system to select. Protective relays and devices have been developed over 100 years ago to provide “lastline” of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. Types of Protective Relays: Protective relays are categorized by their mechanism (electromagnetic, static, mechanical) and function. A protective relay is basically an electrical device that detects a fault in a power system and initiates the operation of the circuit breaker to isolate the defective section or component from the rest of the system. In other words, the prime function of protective relays is the timely and. The relays are in round glass cases.
