

# What types of secondary power distribution boxes are there in a factory building

## Overview

Sub-distribution power boxes, sometimes known as secondary electrical panels or subpanels, distribute power from the main panel to specific areas within an industrial facility. These boxes are especially useful in large settings where separate power management is required for. Primary distribution systems consist of feeders that deliver power from distribution substations to distribution transformers. A feeder usually begins with a feeder breaker at the distribution substation. Many feeders leave substation in a concrete ducts and are routed to a nearby pole. In India, the secondary distribution employs 440V (3-phase) & 230V (1-phase), 3-phase 4-wire system. We'll chat about what each one does, where it shines, and then dive into how to choose the perfect box for your needs.
